Partition walls made with Schlüter-KERDI-BOARD

Ideal tile substrate

Sanitary installations frequently require partition walls to create separate shower or toilet stalls or to divide rooms. The construction of such walls using masonry blocks or stud framing with sheathing is time-consuming and often requires further preparation before tiling can begin.

Suitable panel thicknesses of Schlüter-KERDI-BOARD can be used to quickly and simply create stable and self-supporting partition walls that are immediately ready for tiling. If required, the partition walls can be further attached or stabilized with the angled and U-shaped profiles, which form part of the complete system. The abutting seams and joints must be filled with thin-set mortar. Stainless steel profiles can be used to cover the visible areas.

Schlüter-KERDI-BOARD is ideally suited to create anything from simple partitions to entire toilet and shower facilities or public changing rooms.

Suitable panel thicknesses of Schlüter-KERDI-BOARD

Depending on project requirements, panel thicknesses of 2" (50 mm) should be used for self-supporting partition walls.
